**9.**

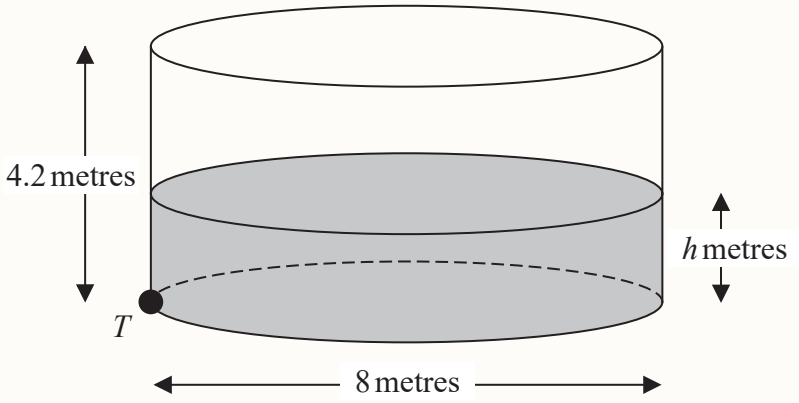

**Figure 4**

Figure 4 shows a cylindrical tank that contains some water.

The tank has an internal diameter of 8 m and an internal height of 4.2 m.

Water is flowing into the tank at a constant rate of $(0.6\pi)\text{m}^3$ per minute.

There is a tap at point $T$ at the bottom of the tank.

At time $t$ minutes after the tap has been opened,

- the depth of the water is $h$ metres
- the water is leaving the tank at a rate of $(0.15\pi h)\text{m}^3$ per minute

(a) Show that

$$\frac{\mathrm{d}h}{\mathrm{d}t} = \frac{12 - 3h}{320}$$

**(4)**

Given that the depth of the water in the tank is 0.5 m when the tap is opened,

(b) find the time taken for the depth of water in the tank to reach 3.5 m.

**(6)**
